Background

This gene encodes a protein kinase similar to a protein kinase which is specific for the SR (serine/arginine-rich domain) family of splicing factors. A highly similar protein has been shown to play a role in muscle development in mice. Multiple transcript variants encoding different isoforms have been found for this gene. [provided by RefSeq, Dec 2009], catalytic activity: ATP + a protein = ADP + a phosphoprotein., function: Required for normal muscle development., similarity: Belongs to the protein kinase superfamily., similarity: Belongs to the protein kinase superfamily. CMGC Ser/Thr protein kinase family., similarity: Contains 1 protein kinase domain., tissue specificity: Exclusively expressed in skeletal and heart muscle.,
